

COMPREHENSIVE EFFICIENCY ANALYSIS AND IMPROVEMENT STRATEGY

As starting point of my activity as Consultant, my objective is to understand in depth your current operation model to jointly identify improvement opportunities that are practical and generate rapid and sustainable impact toward the improvement of efficiency and tile quality if necessary.

My initial focus would center on:

1. Understanding of Current Structure and Processes

- To analyze together with your team the organizational structure, shifts, production and maintenance schedules, and workforce distribution.
- The objective is to understand the current work dynamics and responsibility flows.

2. Evaluation of Measurement and Control Systems

- To review existing data about efficiency, maintenance and product quality.
- This will allow to establish a clear and objective baseline from which to measure progress toward established objectives.

3. Diagnosis of Capabilities and Operational Practices

To explore:

- Current efficiency and maintenance management practices.
- The plant data collection system and its usefulness.
- The training and skill level of operators and mechanics, to enhance their practical knowledge.
- Finished product quality controls.

4. Development and Implementation of a Comprehensive Management System

Based on the analysis, to design and implement a practical and visual system that transforms philosophy into daily actions.

This system will articulate in three fundamental pillars:

4.1. Structured Checklist and Data Collection System

- **Daily Checklists for Operators:** To create visual and simple verification lists, focused on equipment under their responsibility.

These lists will focus on:

- Detection of easily detectable anomalies (leaks, noises, vibrations, temperatures).
- Verification of basic quality and safety points.
- Basic cleaning and organization (5S) of their work area.

- **Checklists for Mechanics (Preventive Maintenance):** To develop technical protocols for:
- **Running Inspections:** Complementary verification of operator reports.
- **Scheduled Preventive Maintenance:**
 - **Daily:** Verification of critical equipment elements.
 - **Weekly:** Checking of complete systems (push chains, demolding machines, elevators, etc.).
 - **Monthly:** Deep inspections and measurements with specific equipment (equipment elongations and wear).

4.2. Staggered Preventive Maintenance Plan

To implement a clear and shared maintenance schedule, that assigns specific tasks to each frequency (daily, weekly, monthly), guaranteeing that each equipment receives necessary attention to operate with maximum reliability and avoid unexpected stops.

4.3. Clarification of Roles and Responsibilities in the Improvement Flow

To define in explicit and consensual manner the functions of each profile in this new system:

- **The Operator:** Is the "sensor" and first transmitter". Their responsibility is observation, initial data collection and basic autonomous maintenance (according to their skills). Also to propose possible improvements. They are the pillar of early detection of potential problems in the production line equipment.
- **The Mechanic:** Is the "diagnostician and specialist". Their role is to validate alerts, execute scheduled preventive maintenance, diagnose root causes of failures and to propose possible technical improvements in monthly meetings.
- **Factory Management:** Must be the "facilitator and strategist". Their function is to guarantee resources, prioritize actions based on collected data and lead the implementation of structural improvements.

Implementation Philosophy:

This system doesn't seek to create bureaucracy, but to enhance and give structure to the knowledge that already exists in the plant.

By standardizing and clarifying tasks, we empower each team member, allowing them to contribute with their specific experience and knowledge to the common objective: a more efficient, predictable and competitive factory.

5. Empowerment of Human Capital: The Operator as Pillar

I start from the basis that each operator is the main knower of their equipment. My proposal focuses on structuring and enhancing that knowledge, providing them with the tools and minimum necessary training so their work in data collection and basic maintenance (if possible) becomes even more effective and contributes directly to collective advancement.

Work Philosophy:

My role is to be a facilitator.

I will work based on your current operation, respecting your culture and experience, and we will only introduce changes where a clear improvement opportunity exists, always in consensual manner and with focus on achieving your strategic objectives in the most agile way possible.
