

Evaluation of Timings and Responsibilities (220925)

1. Daily Maintenance (10-15 minutes) - Responsible: Machine Operator

- Superficial cleaning with an air gun and visual inspection, performed during the downtime at the end of production (integrated into the standard workstation cleaning and tidying routine).

2. Weekly Maintenance (Total duration: 60 minutes)

- A production stop of 30-60 minutes is scheduled, typically on a fixed day (e.g., Friday afternoon). The alternative is having a dedicated person handle this after production ends.
- **Phase 1 (30 min) - Operator:** Thorough cleaning of the chain and components. This removes heavy debris, allowing the mechanic to work efficiently and safely.
- **Phase 2 (30 min) - Mechanic:** Exhaustive technical inspection (according to a checklist) of alignment, sprocket wear, lubrication, and tension adjustment. The prior work by the operator makes the mechanic's 30 minutes highly productive.

3. Monthly / Bimonthly Maintenance (30 minutes) - Responsible: Mechanic

- Measurement checks (chain elongation, clearances) and verification of technical parameters.
- Based on the results, the frequency can be extended to bimonthly (every 2 months).
- This task is performed immediately after the scheduled weekly cleaning, taking advantage of the machine already being stopped and clean. The 30 minutes are added to the weekly stop on that specific day.
